

Week 1 Project Brief

App Name

Sentinaut

Project Overview

Sentinaut is a web-based guest review sentiment classifier designed for homestay and eco-tourism operators who receive feedback across platforms such as Google Reviews, Booking.com, Airbnb, and direct messages. The target users are staff members and managers at small homestays who need a fast way to understand guest sentiment, identify recurring service themes, and prepare appropriate responses without manually reading every review in detail.

The application will allow a staff member to paste a single review or a batch of reviews, one review per line. For each review, the system will classify the sentiment as positive, neutral, or negative, assign one primary theme tag such as food, host, location, cleanliness, value, or experience, and generate a one-line suggested management response. Results will be shown in a clean table so staff can scan feedback quickly and take action. The AI-powered feature will use the Google Gemini Flash or Flash-Lite API for structured classification and response generation. The planned tech stack includes React.js for the frontend, Node.js/Express for the backend, MongoDB for storage, GitHub for version control, and Vercel plus Render for deployment. The 9-week scope is realistic because it begins with a simple prototype and gradually adds API integration, testing, deployment, and user feedback.

3-5 Core Features

- Single review and batch review input.
- Sentiment classification: positive, neutral, or negative.
- Primary theme tagging: food, host, location, cleanliness, value, or experience.
- One-line management response suggestion.
- Clean results table with export-friendly output.

AI Feature Planned

Use the Google Gemini Flash or Flash-Lite API to return structured JSON containing sentiment, theme, confidence, and suggested response for every review.

Proposed Tech Stack

- Frontend: React.js (with Tailwind CSS)

- Backend: Node.js/Express
- Database: MongoDB
- Version Control: GitHub
- Deployment: Vercel (Frontend), Render (Backend)
- AI Integration: Google Gemini Flash/Flash-Lite API
